

PHYSICAL TRAINING MACHINE OPERATION SYSTEM AND METHOD

BACKGROUND OF THE INVENTIONField of the Invention

5 The present invention relates to physical training machines used in health promotion facilities like sports clubs and in homes of individuals, and especially to a physical training machine operation system and a method adapted to present up-to-date exercise programs making use
10 of results of medical science, exercise physiology, and so on, inexpensively and specifically for individual users.

Description of the Related Art

Along with increased recent anxiety for health and necessity of health promotion activities toward the aging
15 society, more and more people have come to do physical training in sports clubs or other health promotion facilities and/or in homes of individuals using physical training machines such as bicycle-type ergometers, for example. Such training machines, in general, incorporate therein exercise
20 programs like physical fitness measuring programs or physical training programs as fixed software (control programs).

Recently, along with rapid developments of medical science, exercise physiology, and so on, there is a continuous change in standard and method of physical strength estimation,
25 and it is desired to provide users with up-to-date exercise programs making use of results of medical science, exercise physiology, and so on. On the other hand, generation of users has come to range from that of younger people to that of elderly people, and it is desired to provide optimum exercise
30 programs meeting the purposes of exercises and physical strength levels of individual users.

With conventional physical training machines, however, users are supplied with exercise programs in form of fixed built-in software. Therefore, to introduce an up-to-date
35 exercise program making use of results of medical science, exercise physiology, and other sciences, it is necessary to buy a new physical training machine, itself, or software,

10092559-030907

which invites a considerable expense.

Additionally, in order to cope with all users of wide age brackets that are different in purpose of exercises and physical strength level, a plurality of physical training machines as many as different kinds of built-in exercise programs have to be equipped. This results in a large running cost.

SUMMARY OF THE INVENTION

It is therefore an object of the present invention to provide a physical training machine operation system and its method adapted to present up-to-date exercise programs making use of results of medical science, exercise physiology and other like sciences, inexpensively and specifically for individual users.

According to the first aspect of the present invention, there is provided a physical training machine operation system comprising: a physical training machine; and a server connected to the physical training machine via a network and holding a plurality of different kinds of exercise programs to be used in the physical training machine, and wherein the server selects a specific exercise program from the different kinds of exercise programs in response to a request of a user, so that the selected exercise program is supplied to the physical training machine.

In the first aspect of the present invention, the physical training machine operation system preferably includes a registration device that registers a personal information datum of a user, and the server preferably selects a specific program from the different kinds of exercise programs in accordance with the personal information datum registered by the registration device. The system preferably includes an input device that inputs an identification information datum of a user, and the server preferably extracts a specific personal information datum of a user from personal information data registered by the registration device with reference to the identification information datum of the user inputted by the input device, and selects a

200902559 "030302

specific exercise program from the different kinds of the exercise programs in accordance with the extracted personal information datum of the user. Also, the physical training machine operation system preferably includes an
5 identification information carrier that carries an identification information datum of a user, and the input device preferably reads out an identification information datum of a user from the identification information carrier. The identification information carrier preferably carries
10 accounting charge information datum together with an identification information datum of a user. Furthermore, a personal information datum registered by the registration device is preferably managed on the server. A result of use of the physical training machine by a user is preferably
15 managed on the server as a personal information datum of the user. Additionally, the server is preferably connected to the training machine via the Internet.

According to the second aspect of the present invention, there is provided a physical training machine
20 operation method comprising the steps of selecting a specific exercise program from a plurality of different kinds of exercise programs stored in a server in response to a request of a user that uses a physical training machine; and supplying the selected exercise program from the server to the physical
25 training machine via a network.

In the second aspect of the present invention, the method preferably includes the step of registering a personal information datum of a user, and the selection step preferably selects a specific exercise program from the different kinds
30 of exercise programs in accordance with the registered personal information datum of the user.

According to the present invention, since any of exercise programs stored in the server is supplied to the training machine in response to a user's request via a network,
35 up-to-date programs making use of results of medical science, exercise physiology or other sciences can be presented inexpensively and specifically for individual users.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a diagram that shows a network configuration of a training machine operation system according to an embodiment of the present invention;

Fig. 2 is a perspective view of a training machine used in the training machine operation system shown in Fig. 1;

Fig. 3 is a diagram that shows the detail of a control panel of the training machine shown in Fig. 2;

Fig. 4 is a block diagram that shows a system configuration of the training machine operation system shown in Fig. 1;

Fig. 5 is a diagram for explaining procedures of membership registration processing and training machine usage processing with the training machine operation system shown in Fig. 4; and

Fig. 6 is a diagram for explaining procedures of accounting processing with the training machine operation system shown in Fig. 4.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Embodiments of the present invention will now be explained below with reference to the drawings. Figs. 1 through 6 are diagrams illustrating an embodiment of the physical training machine operation system according to the present invention.

First referring to Fig. 1, a network configuration of the training machine operation system according to the embodiment will be explained.

As shown in Fig. 1, the training machine operation system according to the embodiment is constructed by connecting various kinds of machines installed in a health promotion facility 10, home 20 and operation business entity's facility 30 altogether via an external network 22 such as Internet.

In the health promotion facility 10, a plurality of training machines 12 are installed and connected together

via a private network 11 such as LAN (Local Area Network). The private network 11 includes a private server 13 connected thereto for the facility, and the respective training machines 12 connected to the private network 11 are connected to an external network 22 via the private server 13. Further connected to the private network 11 are a personal computer 14, automatic vending machine 15 and information panel 16 installed in a lobby, for example, in the health promotion facility 10.

On the other hand, a training machine 21 is installed in the home 20 and connected to the external network 22.

In the operation business entity's facility 30, a management server 31 is installed and connected to the external network 22. The management server 31 has different kinds of exercise programs (physical fitness measurement programs, training programs, and so on) to be used in the training machines 12 and 21 to select particular one of the different kinds of exercise programs in response to a user's request and supply the selected exercise program to the training machine 12 and 21 via the external network 22 and the private network 11. The exercise programs to be supplied to the training machines 12 and 21 may be in any form among software for controlling the training machines 12 and 21 (control programs), parameters used by incorporating them into such software (control programs), and control signals for controlling the training machines 12 and 21.

Figs. 2 and 3 are diagrams illustrating examples of training machine 12 and 21 installed in the health promotion facility 10 or individual home 20.

As shown in Fig. 2, the training machine 12 and 21 includes a training machine main body 17, and a control unit 40 mounted on an external housing of the training machine main body 17 to control behaviors of the training machine main body 17.

The training machine main body 17 shown here is a bicycle type ergometer including a saddle 17a, pedals 17b and a handle 17c like a normal bicycle as shown in Fig. 2

such that a user sitting on the saddle 17a can conduct pedaling exercise by grasping the handle 17c and operating the pedals 17b by feet. The training machine main body 17 can be adjusted in height of the saddle 17a, position of the handle 17b, and so forth, such that any user can take his/her own best posture. An electromagnetic brake-type load-generating device (not shown) is connected to the pedals 17b to apply a constant load to the user.

The control unit 40 includes, as shown in Fig. 3, a control box 48 for controlling the load-generating device (not shown) of the training machine main body 17 by using the pulse of a user detected by a pulse detector (not shown), and a control panel 41 connected to the control box 48. The control panel 41 has a touch panel 41a manipulated to input or output various data, a loudspeaker 42 for emitting an alarm sound or music to the user, a microphone 43 introducing a user's voice, or the like, and a CCD camera 44 for taking images of the user's exercising scenes. The control panel 41 includes, as an interface to the exterior, an infrared port 45, a PCMCIA (Personal Computer Memory Card International Association) card slot 46, and an Ethernet connector 47, and it is connected to the private network 11 via the Ethernet connector 47.

Since the training machines 12 and 21 shown in Figs. 2 and 3 are connected to each other via the private network 11 and the external network 22, the system can deliver music, video, games and other contents to users under physical fitness tests or physical training with the training machines 12 and 21, or can provide various kinds of information such as guidance of the facility, current availability of machines, and so on, from the management server 31 or a specific web site on the external network 22 such as Internet via the control panel 41 of the control unit 40. Alternatively, those contents and various kinds of information can be delivered or provided by using the personal computer 14, information panel 16, or the like, connected to the private network 11.

20250901 09:55:26

Next referring to Fig. 4, a system configuration of the physical training machine operation system shown in Figs. 1 through 3 will be explained.

As shown in Fig. 4, the health promotion facility 10 is equipped with a member registration device (registration device) 19a for registering members by registering personal information (ages, genders, physical fitness levels, health conditions, exercise histories, purposes of exercises, and so on) of individual users 50, an ID registration device 19b for registering IDs (identification information) of the users in ID tags (identification information carriers) 51, an ID read-out device (read-out device) 19c for reading IDs of the users 50 from the ID tags 51, a charge registration device 19d for registering accounting charge information of the users 50 in the ID tags 51, and a charge calculator 19e for checkout processing using the accounting charge information registered in the ID tag 51. The member registration device 19a, ID registration device 19b and charge registration device 19d are incorporated in the personal computer 14 such that data can be written in and read out from the ID tag 51 via various interfaces provided in the personal computer 14. The ID read-out device 19c is incorporated in the control unit 40 of the training machine 12 such that data is written in and read out from the ID tag 51 through an infrared port 45, or the like, of the control unit 40. The charge calculator 19e is incorporated in the automatic vending machine 15 such that data can be written in and read out from the ID tag 51 through various interfaces provided in the automatic vending machine 15. ID tags 51 are held on locker keys carried by individual users within the health promotion facility 10, watches or pedometers daily used by the users.

The private server 13 is connected to the member registration device 19a, ID registration device 19b, ID read-out device 19c and charge registration device 19d via the private network 11 to manage personal information of the users 50 registered by the member registration device 19a. Personal information of the users 50 managed by the private

server 13 include results of the use of the training machine 12 (results of physical fitness measurement, physical training, and so on) of the users 50 in addition to their ages, genders, physical fitness levels, health conditions, exercise histories, purposes of the exercises, and so on, of the users 50. Further, based on an ID of the user 50 read out from the private server 13 by the ID read-out device 19c, personal information of a specific user is extracted from personal information of the users registered by the member registration device 19a, and an exercise program to be supplied to the training device 12 or 21 is selected in accordance with the extracted personal information of the specific user.

The private server 13 is connected to the management server 31 in the operation business entity's facility 30 under unitary management by the operation business entity via the external network 22 such as Internet. The management server 31 includes a program server 31a that holds different kinds of exercise programs such that exercise programs stored in the private server 13 in the health promotion facility 10 and exercise programs stored in the training machine 12 in the home 20 can be renewed any time. Additionally, the management server 31 includes a customers management server 31b for managing personal information of users 50 as customers data base (personal cards) to enable exchange of management information between the private server 13 in the health promotion facility 10 and the training machine 21 in the home 20 any time.

Next explained are operations of the instant embodiment having the above-explained configuration.

First referring to Fig. 5, procedures of member registration processing and training machine usage processing in the health promotion facility 10 of the physical training operation system shown in Fig. 4 will be explained.

Users 50 are registered as members by registering their personal information (ages, genders, physical fitness levels, health conditions, exercise histories, purposes of exercises,

and so on) by means of the member registration device 19a in the health promotion facility 10 (step 101). Thereby, personal information of the users 50 is stored as management information in both the private server 13 and the customers management server 31b of the operation business entity's facility 30 (step 102).

After that, IDs of the users 50 are issued from the customers management server 31b in the operation business entity's facility 30 (step 103), and they are written on the ID tags 51 (step 104).

The ID tags 51 with IDs of the users 50 are delivered to the respective users 50 (step 105).

After that, each user 50 having received such an ID tag 51 inputs his/her use request to the training machine 12 through the control unit 40 of the training machine 12 (step 201). Simultaneously, the user 50 connects his/her ID tag 51 and the control unit 40 of the training machine 12 via a non-contact interface such as infrared ray, electric wave, or the like. As a result, ID of the user 50 is read from the ID tag 51 by the ID read-out device 19c (step 202), and that ID of the user 50 is input to the training machine 12 (step 203).

Then this ID is queried and verified between the training machine 12 and the private server 13 (steps 204 and 205), and if the user 50 is an authorized user, the use of the machine is approved (step 206).

After that, once the user 50 starts the use of the training machine 12 (step 207), personal information of the user 50 is read out from the private server 13 (step 208), and a specific exercise program is read out from different kinds of exercise programs in accordance with the personal information of the user 50 read out (step 209). As a result, an optimum exercise program meeting his/her purpose of the exercise, physical fitness level, and so forth, is specifically given to the user 50, and the user 50 can do a physical fitness measurement test or training according to the exercise program given in this manner (step 210).

10092559-030802

Exercise programs stored in the private server 13 in the health promotion facility 10 are renewed any time to reflect exercise programs stored in the program server 31a in the operation business entity's facility 30 such that the private
5 server 13 in the health promotion facility 10 always stores up-to-date exercise programs.

The result of the use of the training machine 12 by the user 50 is stored as personal information (management information) of the user 50 in the private server 13 (step
10 211). Management information is exchanged any time between the private server 13 in the health promotion facility 10 and the customers management server 31b in the operation business entity's facility 30.

Next referring to Fig. 5, procedures of training
15 machine usage processing in the home 20 in the physical training machine operation system shown in Fig. 4 will be explained.

The user 50 inputs his/her personal information (age, gender, physical fitness level, health condition, exercise
20 history, purpose of the exercise, and so on) and his/her ID to the training machine 21 in the home 20 (step 301). As a result, personal information of the user 50 is stored as management information in the training machine 21. The procedure of inputting personal information of the user 50
25 may be omitted if it is already stored in the management server 31 (customers management server 31b) in the operation business entity's facility 30 and in the training machine 21 in the home 20.

After that, once the user 50 starts the use of the
30 training machine 21, a specific exercise program is read out from different kinds of exercise programs in accordance with the personal information of the user 50 stored in the training machine 21. Thus an optimum exercise program meeting with the purpose of the exercise, the physical fitness level, and
35 so forth, of the user 50 is specifically given, and the user 50 can do a physical measurement test or training according to the exercise program given in this manner (step 302).

Exercise programs stored in the training machine 21 in the home 20 are renewed any time to reflect exercise programs stored in the program server 31a in the operation business entity's facility 30 such that the training machine 21 in the home 20 always stores up-to-date exercise programs.

The result of the use of the training machine 21 by the user 50 is stored as personal information (management information) of the user 50 in the training machine 21. Management information is exchanged any time between the training machine 21 in the home 20 and the customers management server 31b in the operation business entity's facility 30.

Next referring to Fig. 6, procedures of account processing in the health promotion facility 10 in the physical training machine operation system shown in Fig. 4 will be explained.

The user 50 deposits beforehand a sum for account that will be necessary upon purchasing commodities or using pay-programs (services) through the charge registration device 19d in the health promotion facility 10. Simultaneously, the user 50 connects his/her ID tag 51 and to the charge registration device 19d via a non-contact interface such as infrared ray, electric wave, or the like. As a result, ID of the user 50 is read from the ID tag 51 by the charge registration device 19d (step 402), and this ID of the user 50 is queried and verified between the charge registration device 19d and the private server 13 (and the charge is written) (step 403). After the verification of ID (step 404), the deposited sum for account is written as charge information in the ID tag 51 (step 405).

After that, when the user 50 purchases a commodity (such as canned juice) through the automatic vending machine 15, for example, the user 50 connects his/her ID tag 51 to the charge calculator 19e incorporated in the automatic vending machine 15 via a non-contact interface such as infrared ray, electric wave, or the like. As a result, ID of the user 50 is read out from his/her tag 51 (step 406), and this ID is

queried and verified between the charge calculator 19e and the private server 13 (steps 407 and 408). After the verification of ID, the balance of the account is read out from the ID tag 51 (step 409), and after account processing
5 by the private server 13 (step 410), the balance after the account processing is written in the ID tag 51 (step 411).

After that, a commodity (such as canned juice) is delivered to the user 50 from the automatic vending machine 15 (step 412).

10 As explained above, according to the embodiment of the present invention, since exercise programs stored in the management server 31 in the operation business entity's facility 30 or in the private server 13 in the health promotion
15 facility 10 are supplied to training machines 12 and 21 connected via an external network 20, for example, upon requests from users, it is possible to inexpensively provide up-to-date exercise programs making use of results of medical science, exercise physiology and other sciences, specifically for individual users 50. Thus, each user 50 can
20 do a physical fitness measurement test or physical training according to such an up-to-date exercise program at a reasonable charge for the content of his/her actual use without being compelled to bear a high expense for purchasing a new training machine 12 or 21 itself or new software. In
25 addition, all users 50 over a wide range of generations, different in purposes of exercises, physical fitness levels, and other factors, can be specifically coped with. Since the exercise programs stored in the private server 13 in the health promotion facility 10 are renewed any time to reflect
30 exercise programs stored in the program server 31a in the operation business entity's facility 30, it is sufficient that the operation business entity, for example, renew the exercise programs in the program server 31a of the operation business entity's facility 30, and it is ensured that such
35 renewed exercise programs are automatically supplied to the training machines 12 and 21 installed in the health promotion facility 10 or in the home 20.

Moreover, according to the embodiment of the present invention, since personal information of users 50 is registered in the management server 31 of the operation business entity's facility 30 or in the private server 13 of the health promotion facility 10 such that a specific exercise program is selected from different kinds of exercise programs in accordance with personal information of a particular user 50 registered, it is possible to readily provide each user without specialized knowledge with an optimum exercise program such that the user 50 can effectively conduct a physical fitness measurement test or training. Furthermore, personal information of users 50 registered beforehand can be used to automatically set the upper-limit load during the use of the training machine 12 or 21, or to limit the use of the training machine 12 or 21 itself, users 50 can safely practice the physical fitness measurement test or training.

Additionally, according to the embodiment, since personal information of users 50 is registered in the management server 31 of the operation business entity's facility 30, exercise programs and personal information of an individual user 50 can be shared in the health promotion facility 10 and the home 20, it is not necessary to input personal information of users 50 for each user 50 or each training machine 12 or 21, and rather, each user 50 can do physical fitness measurement tests or physical training similar to those of the health promotion facility in his/her home 20 or in another health promotion facility. Further, since personal information of users 50 (including results of exercises with the training machines 12 or 21) is registered in the management server 31 of the operation business entity's facility 30, whole aspects of health promotion activities of the users 50 can be held under unitary control, and can be effectively used as reference data for exercise prescription by trainers, medical practitioners, or the like, in health promotion facilities, medical organizations, or the like. If an ID read-out device is added

to a personal computer, for example, set in a home, workplace or any other place, and connectable to Internet, it is possible to make reference to data including results of exercises with training machines 12 or 21 from anywhere.

5 Furthermore, according to the embodiment of the present invention, since each ID tag 51 for holding ID of each user 50 is configured to hold accounting charge information, the user 50 can deposit a sum of expected charge beforehand to his/her ID tag 51 to enable account processing without
10 carrying cash for purchasing commodities or using pay programs (services) in the health promotion facility 10. Additionally, since each ID tag 51 is usable for entrance/exit management to and from the health promotion facility 10 as well, all of entrance/exit management, uses of machines,
15 purchasing of commodities, uses of pay programs (services), and others, can be managed only with ID tags 51, thereby to contribute to laborsaving in operation of the health promotion facility 10 and to permit users 50 to dedicate themselves to health promotion activities that are true
20 purposes of the users 50.

In the embodiment explained above, an example was taken for explanation as the charge calculator 19e being incorporated in the automatic vending machine 15; however, not limited to this, the charge calculator 19e may be
25 incorporated in the control unit 40 of the training machine 12 or 21. As identification information carriers, the foregoing embodiment employs the ID tags 51 attached to locker keys, or the like, which the users 50 carry on themselves; however, instead of them, any desired means such as IC cards
30 may be used.

20090909 030002
